
how do i make the results not look ugly? right pic is from effect book.
left pic is from my code thing

Your results aren't "wrong"—they just look raw because you're using default console output. The book is formatting tables for publication. You need a reporting layer on top of your model.

Here are the clean ways to fix it (pick one and stick with it):

1) Use `modelsummary` properly (fastest fix)

You're already using it, but not styling it.

```
library(modelsummary)

modelsummary(
  list("Real" = clfe, "Placebo" = clfe_fake),
  stars = TRUE,
```

R

Better:

```
modelsummary(
  list("Real" = clfe, "Placebo" = clfe_fake),
  stars = TRUE,
  fmt = 2,
  gof_omit = "IC|Log|Adj",
```

R

If you're in RMarkdown or Quarto, this immediately looks like the book.

2) Use `kableExtra` (closest to textbook style)

```
library(modelsummary)
library(kableExtra)

modelsummary(
  list("Real" = clfe, "Placebo" = clfe_fake),
  stars = TRUE,
  output = "kableExtra"
```

R

This is how you get clean, centered, publication-style tables.

3) Use `gt` (modern + very clean)

```
modelsummary(
  list("Real" = clfe, "Placebo" = clfe_fake),
  stars = TRUE,
```

R

This gives you polished tables with minimal effort.

4) If you want EXACT "book" LaTeX look

Books are usually using LaTeX under the hood:

R

```
  output = "latex"
)
```

Then compile in LaTeX or Quarto → PDF.

What you're doing "wrong"

Nothing statistically. But presentation-wise:

- You're printing to console → always ugly
- No formatting engine → no alignment, spacing, labels
- No rendering context (HTML/PDF)

Bottom line

If you want it to look like the book:

- Stop relying on console output
- Use `modelsummary(..., output = "html")` or `"latex"`
- Render in RMarkdown / Quarto

If you want, I can help you match that table **almost exactly line-for-line** (same labels, spacing, notes, etc.).
