take this tibble output and turn it into a latex table? simple formatting.

	name	mspe	aic	bic
1	SLR	821603.5	7389.135	7401.429
2	With weekend	197261.9	6792.044	6808.437
3	Polynomial	183160.7	6764.780	6789.369
4	Full	181944.7	6760.099	6788.785

Here's a clean LaTeX table with minimal formatting:

LaTeX

```
\begin{table}[ht]
\centering
\begin{tabular}{lccc}
\hline
Model & MSPE & AIC & BIC \\
\hline
SLR & 821603.5 & 7389.135 & 7401.429 \\
With weekend & 197261.9 & 6792.044 & 6808.437 \\
Polynomial & 183160.7 & 6764.780 & 6789.369 \\
Full & 181944.7 & 6760.099 & 6788.785 \\
\hline
\end{tabular}
\caption{Model comparison}
\end{table}
```

If you want it tighter (e.g., for a paper), you could drop the caption or switch to `\small` inside the table.

same with this

	(Intercept)	temp	rain_dTRUE	weekendWeekend	temp2
1	TRUE	FALSE	FALSE	TRUE	FALSE
2	TRUE	FALSE	FALSE	TRUE	TRUE
3	TRUE	TRUE	FALSE	TRUE	TRUE
4	TRUE	TRUE	TRUE	TRUE	TRUE

Here's the LaTeX version with simple formatting:

LaTeX

```
\begin{table}[ht]
\centering
\begin{tabular}{lccccc}
\hline
Model & (Intercept) & temp & rain\_dTRUE & weekendWeekend & temp2 \\
\hline
1 & TRUE & FALSE & FALSE & TRUE & FALSE \\
2 & TRUE & FALSE & FALSE & TRUE & TRUE \\
3 & TRUE & TRUE & FALSE & TRUE & TRUE \\
4 & TRUE & TRUE & TRUE & TRUE & TRUE \\
\hline
\end{tabular}
```

```
\caption{Model specification indicators}
\end{table}
```

If you want it cleaner for publication, consider replacing `TRUE/FALSE` with `\checkmark` / blank or 1/0.

fix the formatting?

```
\begin{tabular}[        %% tabularray outer open
entry=none,label=none,
note{}={+ p \num{< 0.1}, * p \num{< 0.05}, ** p \num{< 0.01}, *** p
\num{< 0.001}},
]                       %% tabularray outer close
{                       %% tabularray inner open
colspec={Q[]Q[]Q[]Q[]},
hline{2}={1-4}{solid, black, 0.05em},
hline{8}={1-4}{solid, black, 0.05em},
hline{1}={1-4}{solid, black, 0.08em},
hline{18}={1-4}{solid, black, 0.08em},
column{2-4}={}{halign=c},
column{1}={}{halign=l},
}                       %% tabularray inner close
& Real & Placebo Time & Placebo Borough \\
TreatedTRUE & \num{-20206.267}*** &  &  \\
& (\num{1447.835}) &  &  \\
Treated\_fakeTRUE &  & \num{-24166.208}*** &  \\
&  & (\num{1983.934}) &  \\
Treated\_borough\_fakeTRUE &  &  & \num{-25607.514}*** \\
&  &  & (\num{2644.938}) \\
Num.Obs. & \num{794} & \num{794} & \num{794} \\
R2 & \num{0.981} & \num{0.979} & \num{0.963} \\
R2 Adj. & \num{0.961} & \num{0.958} & \num{0.926} \\
...
RMSE & \num{7002.25} & \num{7295.09} & \num{12791.88} \\
FE: borough & X & X & X \\
FE: date & X & X & X \\
\end{tabular}
```

You've got a couple issues: mismatched row counts vs. `hline{}`, a stray `...`, and inconsistent structure for coefficient/SE rows. Here's a cleaned, compiling version using **tabularray** with consistent formatting:

LaTeX

```
\begin{tblr}{
colspec={lccc},
hline{1} = {1-4}{0.08em},
hline{2} = {1-4}{0.05em},
hline{Z} = {1-4}{0.08em},
column{2-4} = {c},
column{1} = {l},
note{} = {+ p < 0.1, * p < 0.05, ** p < 0.01, *** p < 0.001}
}
& Real & Placebo Time & Placebo Borough \\

TreatedTRUE
  & \num{-20206.267}*** &  &  \\
  & (\num{1447.835})    &  &  \\
```

```
Treated\_fakeTRUE
  &  & \num{-24166.208}*** &  \\
  &  & (\num{1983.934})    &  \\

Treated\_borough\_fakeTRUE
  &  &  & \num{-25607.514}*** \\
  &  &  & (\num{2644.938})    \\

Num.Obs.
  & \num{794} & \num{794} & \num{794} \\
R2
  & \num{0.981} & \num{0.979} & \num{0.963} \\
R2 Adj.
  & \num{0.961} & \num{0.958} & \num{0.926} \\

RMSE
  & \num{7002.25} & \num{7295.09} & \num{12791.88} \\

FE: borough
  & X & X & X \\
FE: date
  & X & X & X \\
}
```

Key fixes:

- Switched to `tblr` (correct environment for `tabularray`)
- Removed invalid `...`
- Replaced hard-coded `hline{8}`, `hline{18}` with `hline{Z}` (last row)
- Standardized coefficient + standard error rows
- Cleaned note syntax (your `\num{< 0.1}` was invalid)

If you want it tighter/more "journal style," next step would be collapsing SEs into parentheses on the same line or switching X → ✓.

turn it into tabular

Your previous version relied on **tabularray** features (`\num`, notes, flexible hlines). Plain `tabular` is stricter, so you need to simplify a bit. Here's a clean, compiling version:

LaTeX

```
\begin{table}[ht]
\centering
\begin{tabular}{lccc}
\hline
 & Real & Placebo Time & Placebo Borough \\
\hline

TreatedTRUE
  & -20206.267*** &  &  \\
  & (1447.835)    &  &  \\

Treated\_fakeTRUE
  &  & -24166.208*** &  \\
  &  & (1983.934)    &  \\

Treated\_borough\_fakeTRUE
  &  &  & -25607.514*** \\
  &  &  & (2644.938)    \\

\hline
```

```
Num.Obs.
  & 794 & 794 & 794 \\
R2
  & 0.981 & 0.979 & 0.963 \\
R2 Adj.
  & 0.961 & 0.958 & 0.926 \\

RMSE
  & 7002.25 & 7295.09 & 12791.88 \\

FE: borough
  & X & X & X \\
FE: date
  & X & X & X \\
\hline
\end{tabular}
\caption{Regression results}
\begin{flushleft}
{\footnotesize + p $<$ 0.1, * p $<$ 0.05, ** p $<$ 0.01, *** p $<$ 0.001}
\end{flushleft}
\end{table}
```

What changed (and why):

- Dropped `\num{}` → requires `siunitx`; plain numbers are safer
- Moved the note outside → `tabular` doesn't support built-in notes
- Replaced fancy `hline{}` rules with standard `\hline`
- Kept coefficient/SE structure intact

If you're submitting to a journal, the next upgrade would be using `booktabs` (`\toprule`, `\midrule`, `\bottomrule`)—it looks noticeably more professional.

format this please? im not submitting to a journal, just trynna get this done before midnight.

	name	mspe	aic	bic
1	SLR	141050055935	50964.27	50980.74
2	With weekend	128261297095	50816.39	50838.34
3	Polynomial	128443766089	50812.96	50845.88
4	Full	128433225227	50814.78	50853.20

No need to overthink it—here's a clean, no-frills LaTeX table that will compile and look fine:

LaTeX

```
\begin{table}[ht]
\centering
\begin{tabular}{lccc}
\hline
Model & MSPE & AIC & BIC \\
\hline
SLR & 141050055935 & 50964.27 & 50980.74 \\
With weekend & 128261297095 & 50816.39 & 50838.34 \\
Polynomial & 128443766089 & 50812.96 & 50845.88 \\
Full & 128433225227 & 50814.78 & 50853.20 \\
\hline
\end{tabular}
\caption{Model comparison}
\end{table}
```

If you've got 30 seconds extra, you can make it more readable by shortening numbers (e.g., divide MSPE by 10^9), but this is perfectly acceptable as-is.

how to format this? dont interpret or try to say anything about it.

```
    Durbin-Watson test

data:  mod3
DW = 0.99115, p-value < 2.2e-16
alternative hypothesis: true autocorrelation is greater than 0
```

Keep it simple and consistent with your other tables. Here are two clean options:

Option 1: Minimal table

```latex
\begin{table}[ht]
\centering
\begin{tabular}{lc}
\hline
Statistic & Value \\
\hline
Durbin--Watson & 0.99115 \\
p-value & $< 2.2 \times 10^{-16}$ \\
Alternative & Greater autocorrelation \\
\hline
\end{tabular}
\caption{Durbin--Watson test (mod3)}
\end{table}
```

Option 2: Inline (if you don't want a table)

```latex
\textbf{Durbin--Watson test (mod3)}: DW = 0.99115, $p < 2.2 \times 10^{-16}$; alternative
```

this matrix as well.

```
   (Intercept)   temp    rain_dTRUE weekendWeekend
boroughBrooklyn    boroughManhattan boroughQueens  temp2
1  TRUE   FALSE  FALSE  FALSE  FALSE  TRUE   FALSE  FALSE
2  TRUE   FALSE  FALSE  FALSE  TRUE   TRUE   FALSE  FALSE
3  TRUE   FALSE  FALSE  TRUE   TRUE   TRUE   FALSE  FALSE
4  TRUE   FALSE  FALSE  TRUE   TRUE   TRUE   TRUE   FALSE
5  TRUE   FALSE  FALSE  TRUE   TRUE   TRUE   TRUE   TRUE
6  TRUE   TRUE   FALSE  TRUE   TRUE   TRUE   TRUE   TRUE
7  TRUE   TRUE   TRUE   TRUE   TRUE   TRUE   TRUE   TRUE
```

but take out the word borough

Here it is cleaned up, with **"borough" removed from column names** and formatted as a simple LaTeX table:

LaTeX

```
\begin{table}[ht]
\centering
\begin{tabular}{lcccccccc}
\hline
Model & (Intercept) & temp & rain\_dTRUE & weekendWeekend & Brooklyn & Manhattan & Queens
\hline
1 & TRUE & FALSE & FALSE & FALSE & FALSE & TRUE  & FALSE & FALSE \\
2 & TRUE & FALSE & FALSE & FALSE & TRUE  & TRUE  & FALSE & FALSE \\
3 & TRUE & FALSE & FALSE & TRUE  & TRUE  & TRUE  & FALSE & FALSE \\
4 & TRUE & FALSE & FALSE & TRUE  & TRUE  & TRUE  & TRUE  & FALSE \\
5 & TRUE & FALSE & FALSE & TRUE  & TRUE  & TRUE  & TRUE  & TRUE  \\
6 & TRUE & TRUE  & FALSE & TRUE  & TRUE  & TRUE  & TRUE  & TRUE  \\
7 & TRUE & TRUE  & TRUE  & TRUE  & TRUE  & TRUE  & TRUE  & TRUE  \\
\hline
\end{tabular}
\caption{Model specification matrix}
\end{table}
```

That will compile cleanly and stay consistent with your earlier tables.

how to force the picture where you want it? even if it pushes then next paragraph to the next page?

You don't get that behavior by default in LaTeX—floats *float*. If you want to force a figure exactly **here**, you have a few options:

1. The blunt (works 99% of the time)

Add this to your preamble:

LaTeX

```
\usepackage{float}
```

Then use:

LaTeX

```
\begin{figure}[H]
\centering
\includegraphics{yourfile}
\caption{...}
\end{figure}
```

`[H]` = "put it **HERE**, don't move it."
This will push text to the next page if needed.

---

2. Slightly less aggressive

LaTeX

```
\begin{figure}[htbp]
```

This *suggests* placement (here, top, bottom, page), but LaTeX can still override you. Not what you want if you're trying to force it.

3. Force all earlier floats out before continuing

If things are stacking weirdly:

```latex
\usepackage{placeins}
```

Then:

```latex
\FloatBarrier
```

This forces all pending figures to be placed before continuing.

Bottom line

Use `[H]` from the `float` package. It's the simplest and does exactly what you asked: locks the figure in place and pushes text if necessary.

how to make this shorter?

```
% Table created by stargazer v.5.2.3 by Marek Hlavac, Social Policy Institute. E-mail: marek.hlavac at gmail.com

\end{tabular}
}

*do not interpret or say anything other than formatting stuff

You've got a lot of vertical padding and redundant lines. Strip that out and it becomes much tighter without losing content.

Here's a **shortened version**:

LaTeX

```
\begin{table}[ht]
\centering
\small
\begin{tabular}{lcccc}
\hline
 & \multicolumn{4}{c}{ridership} \\
 & (1) & (2) & (3) & (4) \\

\multicolumn{5}{l}{\footnotesize $^{***}$p$<$0.01, $^{**}$p$<$0.05, $^{*}$p$<$0.1}
\end{tabular}
\end{table}
```

What I removed/changed:

- Deleted all `\\[-1.8ex]` spacing hacks
- Removed empty spacer rows
- Dropped duplicate “df” lines
- Shortened labels (`Adj. R^2` , `Res. SE` , etc.)
- Added `\small` instead of `\resizebox` (cleaner + less distortion)

If you still need it tighter, next step is `\scriptsize` .

find a happy medium. it can be one inch longer in total. apply that formatting to this as well

```

```

latex to put these two together? side by side, keeping proportions

```
\begin{figure}[!ht]
   \centering
   \caption{Daily turnstile counts at a subway station in Queens, NYC}
   \label{fig:enter-label}
   \includegraphics[width=.45\columnwidth]
{figures/astoria/scatter_astoria.png}
   \caption*{\footnotesize \textit{Note: Ridership, on average, is lower
```

on the weekends compared to weekdays, regardless of temperature (in Fahrenheit)}}
\end{figure}

\begin{figure}[H]
\centering
\caption{Variables for Astoria}
\label{fig:enter-label}
\includegraphics[width=.45\columnwidth]{figures/astoria/dist_variables_astoria.png}
\caption*{\footnotesize \textit{Note: The snow and rain variables are skewed heavily}}
\end{figure}

Use a single `figure` with **subfigures**. This keeps them side-by-side and preserves proportions.

Add this to your preamble if you don't already have it:

```LaTeX
\usepackage{subcaption}
```

Then:

```LaTeX
\begin{figure}[H]
\centering

\begin{subfigure}{0.48\textwidth}
    \centering
    \includegraphics[width=\linewidth]{figures/astoria/scatter_astoria.png}
    \caption{Daily turnstile counts at a subway station in Queens, NYC}
\end{subfigure}
\hfill
\begin{subfigure}{0.48\textwidth}
    \centering
    \includegraphics[width=\linewidth]{figures/astoria/dist_variables_astoria.png}
    \caption{Variables for Astoria}
\end{subfigure}

\caption{Astoria data visualizations}
\caption*{\footnotesize \textit{Left: Ridership is lower on weekends regardless of temper
\end{figure}
```

Key points:

- `0.48\textwidth` keeps them balanced with a small gap
- `\linewidth` inside each subfigure preserves proportions
- One main caption + optional combined note keeps it clean

these guys next to each other

\begin{figure}[H]
\centering
\caption{Figure Title}
\label{fig:enter-label}
\includegraphics[width=.55\columnwidth]{figures/did/dist_bh.png}

```
    \caption*{\footnotesize \textit{Note: Describe the figure above.}}
\end{figure}

\begin{table}[ht]
    \centering
    \caption{Regression Results}
    \label{tab:did}
    \input{tables/did_results}
    \caption*{\footnotesize \textit{Note: Describe the table above.}}
\end{table}
```

Wrap them in `minipage` s inside a single `figure` . That's the simplest way to align a plot and a table side by side.

LaTeX

```
\begin{figure}[H]
\centering

\begin{minipage}{0.48\textwidth}
    \centering
    \includegraphics[width=\linewidth]{figures/did/dist_bh.png}
    \captionof{figure}{Figure Title}
    \label{fig:did_plot}
    \caption*{\footnotesize \textit{Note: Describe the figure above.}}
\end{minipage}
\hfill
\begin{minipage}{0.48\textwidth}
    \centering
    \captionof{table}{Regression Results}
    \label{tab:did}
    \input{tables/did_results}
    \caption*{\footnotesize \textit{Note: Describe the table above.}}
\end{minipage}

\end{figure}
```

Important:
Add this to your preamble:

LaTeX

```
\usepackage{caption}
```

This keeps proportions (`\linewidth`), aligns them cleanly, and lets each keep its own caption type.

my b. this

```
\begin{figure}[!ht]
    \centering
    \caption{Figure Title}
    \label{fig:enter-label}
    \includegraphics[width=.55\columnwidth]
{figures/did/did_dots.png}
    \caption*{\footnotesize \textit{Note: Describe the figure above.}}
\end{figure}

\begin{figure}[H]
```

```
    \centering
    \caption{Figure Title}
    \label{fig:enter-label}
    \includegraphics[width=.55\columnwidth]{figures/did/dist_bh.png}
    \caption*{\footnotesize \textit{Note: Describe the figure above.}}
\end{figure}
```

Same idea—use one `figure` and split into two blocks. No extra packages needed if you don't want subcaptions:

LaTeX

```
\begin{figure}[H]
\centering

\begin{minipage}{0.48\textwidth}
    \centering
    \includegraphics[width=\linewidth]{figures/did/did_dots.png}
    \caption{Figure Title}
    \caption*{\footnotesize \textit{Note: Describe the figure above.}}
\end{minipage}
\hfill
\begin{minipage}{0.48\textwidth}
    \centering
    \includegraphics[width=\linewidth]{figures/did/dist_bh.png}
    \caption{Figure Title}
    \caption*{\footnotesize \textit{Note: Describe the figure above.}}
\end{minipage}

\end{figure}
```

If LaTeX complains about captions inside `minipage`, add this to your preamble:

LaTeX

```
\usepackage{caption}
```

That's it—keeps proportions and forces them side by side.
